Craig Leres

ITC revisions by *David King*

Version 2.19

April 25, 1984

1. Introduction

Mail provides a simple and friendly environment for sending and receiving mail. It divides incoming mail into its constituent messages and allows the user to deal with them in any order. In addition, it provides a set of *ed*-like commands for manipulating messages and sending mail. *Mail* offers the user simple editing capabilities to ease the composition of outgoing messages, as well as providing the ability to define and send to names which address groups of users. Finally, *Mail* is able to send and receive messages across such networks as the ARPANET, UUCP, and Berkeley network.

This document describes how to use the *Mail* program to send and receive messages. The reader is not assumed to be familiar with other message handling systems, but should be familiar with the UNIX[1] shell, the text editor, and some of the common UNIX commands. "The UNIX Programmer's Manual," "An Introduction to Csh," and "Text Editing with Ex and Vi" can be consulted for more information on these topics.

Here is how messages are handled: the mail system accepts incoming *messages* for you from other people and collects them in a file or directory, called your *system mailbox*. When you login, the system notifies you if there are any messages waiting in your system mailbox. If you are a *csh* user, you will be notified when new mail arrives if you inform the shell of the location of your mailbox. On version 7 systems, your

[1] UNIX is a trademark of Bell Laboratories.

system mailbox is located in the directory /usr/spool/mail in a file with your login name. In the ITC system, it can also be located in the directory "Mailbox" in your home directory; if you create such a directory, the mail system will use it. If your login name is "sam," then you can make *csh* notify you of new mail by including the following line in your .cshrc file:

```
set mail=/usr/spool/mail/sam
```

or, in the ITC system,

```
set mail=/user/sam/Mailbox
```

When you read your mail using *Mail*, it reads your system mailbox and breaks it up into the individual messages that have been sent to you. You can then read, reply to, delete, or save these messages. Each message is marked with its author and the date they sent it.

2. *Common usage*

The *Mail* command has two distinct usages, according to whether one wants to send or receive mail. Sending mail is simple: to send a message to a user whose login name is, say, "root," use the shell command:

```
% Mail root
```

then type your message. When you reach the end of the message, type a period at the beginning of a line, followed by a carriage return, which will cause *Mail* to echo "EOT" and return you to the Shell. (You can also use an EOT (control-d) for this purpose.) When the user you sent mail to next logs in, he will receive the message:

```
You have mail.
```

to alert him to the existence of your message.

If, while you are composing the message you decide that you do not wish to send it after all, you can abort the letter with a control-c (you can also use RUBOUT for this.) Typing a single control-c causes *Mail* to print

```
(Interrupt -- one more to kill letter)
```

Typing a second control-c causes *Mail* to save your partial letter on the file "dead.letter" in your home directory and abort the letter. Once you have sent mail to someone, there is no way to undo the act, so be careful.

The message your recipient reads will consist of the message you typed, preceded by a line telling who sent the message (your login name) and the date and time it was sent.

If you want to send the same message to several other people, you can list their login names on the command line. Thus,

```
% Mail sam bob john
Tuition fees are due next Friday.  Don't forget!!
EOT
%
```

will send the reminder to sam, bob, and john.

If, when you log in, you see the message,

```
You have mail.
```

you can read the mail by typing simply:

```
% Mail
```

Mail will respond by typing its version number and date and then listing

the messages you have waiting. Then it will type a prompt and await your command. The messages are assigned numbers starting with 1 -- you refer to the messages with these numbers. *Mail* keeps track of which messages are *new* (have been sent since you last read your mail) and *read* (have been read by you). New messages have an *N* next to them in the header listing and old, but unread messages have a *U* next to them. *Mail* keeps track of new/old and read/unread messages by putting a header field called "Status" into your messages.

To look at a specific message, use the *type* command, which may be abbreviated to simply *t*. For example, if you had the following messages:

```
N 1 root     Wed Sep 21 09:21  "Tuition fees"
N 2 sam      Tue Sep 20 22:55
```

you could examine the first message by giving the command:

```
type 1
```

which might cause *Mail* to respond with, for example:

```
Message  1:
From root  Wed Sep 21 09:21:45 1978
Subject: Tuition fees
Status: R

Tuition fees are due next Wednesday.  Don't forget!!
```

Many *Mail* commands that operate on messages take a message number as an argument like the *type* command. For these commands, there is a notion of a current message. When you enter the *Mail* program, the current message is initially the first one. Thus, you can often omit the message number and use, for example,

```
t
```

to type the current message. As a further shorthand, you can type a message by simply giving its message number. Hence,

```
1
```

would type the first message.

Frequently, it is useful to read the messages in your mailbox in order, one after another. You can read the next message in *Mail* by simply typing a newline. As a special case, you can type a newline as your first command to *Mail* to type the first message.

If, after typing a message, you wish to immediately send a reply, you can do so with the *reply* command. *Reply*, like *type*, takes a message number as an argument. *Mail* then begins a message addressed to the user

who sent you the message. You may then type in your letter in reply, followed by a period at the beginning of a line, as before. *Mail* will type EOT, then type the ampersand prompt to indicate its readiness to accept another command. In our example, if, after typing the first message, you wished to reply to it, you might give the command:

```
reply
```

Mail responds by typing:

```
To: root
Subject: Re: Tuition fees
```

and waiting for you to enter your letter. You are now in the message collection mode described at the beginning of this section and *Mail* will gather up your message up to a line containing only a period. Note that it copies the subject header from the original message. This is useful in that correspondence about a particular matter will tend to retain the same subject heading, making it easy to recognize. If there are other header fields in the message, the information found will also be used. For example, if the letter had a "To:" header listing several recipients, *Mail* would arrange to send your replay to the same people as well. Similarly, if the original message contained a "Cc:" (carbon copies to) field, *Mail* would send your reply to *those* users, too. *Mail* is careful, though, not too send the message to *you*, even if you appear in the "To:" or "Cc:" field, unless you ask to be included explicitly. See section 4 for more details.

After typing in your letter, the dialog with *Mail* might look like the following:

```
reply
To: root
Subject: Tuition fees

Thanks for the reminder
EOT
&
```

The *reply* command is especially useful for sustaining extended conversations over the message system, with other "listening" users receiving copies of the conversation. The *reply* command can be abbreviated to *r*.

Sometimes you will receive a message that has been sent to several people and wish to reply *only* to the person who sent it. *Reply* with a capital *R* replies to a message, but sends a copy to the sender only.

If you wish, while reading your mail, to send a message to someone, but not as a reply to one of your messages, you can send the message directly with the *mail* command, which takes as arguments the names of the recipients you wish to send to. For example, to send a message to

"frank," you would do:

```
mail frank
This is to confirm our meeting next Friday at 4.
EOT
&
```

The *mail* command can be abbreviated to *m*.

Normally, each message you receive is saved in the file *mbox* in your login directory at the time you leave *Mail*. Often, however, you will not want to save a particular message you have received because it is only of passing interest. To avoid saving a message in *mbox* you can delete it using the *delete* command. In our example,

```
delete 1
```

will prevent *Mail* from saving message 1 (from root) in *mbox*. In addition to not saving deleted messages, *Mail* will not let you type them, either. The effect is to make the message disappear altogether, along with its number. The *delete* command can be abbreviated to simply *d*.

Many features of *Mail* can be tailored to your liking with the *set* command. The *set* command has two forms, depending on whether you are setting a *binary* option or a *valued* option. Binary options are either on or off. For example, the "ask" option informs *Mail* that each time you send a message, you want it to prompt you for a subject header, to be included in the message. To set the "ask" option, you would type

```
set ask
```

Another useful *Mail* option is "hold." Unless told otherwise, *Mail* moves the messages from your system mailbox to the file *mbox* in your home directory when you leave *Mail*. If you want *Mail* to keep your letters in the system mailbox instead, you can set the "hold" option.

Valued options are values which *Mail* uses to adapt to your tastes. For example, the "SHELL" option tells *Mail* which shell you like to use, and is specified by

```
set SHELL=/bin/csh
```

for example. Note that no spaces are allowed in "SHELL=/bin/csh." A complete list of the *Mail* options appears in section 5.

Another important valued option is "crt." If you use a fast video terminal, you will find that when you print long messages, they fly by too quickly for you to read them. With the "crt" option, you can make *Mail* print any message larger than a given number of lines by sending it through the paging program *more*. For example, most CRT users should do:

```
set crt=24
```

to paginate messages that will not fit on their screens. *More* prints a screenful of information, then types --MORE--. Type a space to see the next screenful.

Another adaptation to user needs that *Mail* provides is that of *aliases*. An alias is simply a name which stands for one or more real user names. *Mail* sent to an alias is really sent to the list of real users associated with it. For example, an alias can be defined for the members of a project, so that you can send mail to the whole project by sending mail to just a single name. The *alias* command in *Mail* defines an alias. Suppose that the users in a project are named Sam, Sally, Steve, and Susan. To define an alias called "project" for them, you would use the *Mail* command:

```
alias project sam sally steve susan
```

The *alias* command can also be used to provide a convenient name for someone whose user name is inconvenient. For example, if a user named "Bob Anderson" had the login name "anderson,"" you might want to use:

```
alias bob anderson
```

so that you could send mail to the shorter name, "bob."

While the *alias* and *set* commands allow you to customize *Mail*, they have the drawback that they must be retyped each time you enter *Mail*. To make them more convenient to use, *Mail* always looks for two files when it is invoked. It first reads a system wide file "/usr/lib/Mail.rc," then a user specific file, ".mailrc," which is found in the user's home directory. The system wide file is maintained by the system administrator and contains *set* commands that are applicable to all users of the system. The ".mailrc" file is usually used by each user to set options the way he likes and define individual aliases. For example, my .mailrc file looks like this:

```
set ask nosave SHELL=/bin/csh
```

As you can see, it is possible to set many options in the same *set* command. The "nosave" option is described in section 5.

Mail aliasing is implemented at the system-wide level by the mail delivery system *sendmail*. These aliases are stored in the file /usr/lib/aliases and are accessible to all users of the system. The lines in /usr/lib/aliases are of the form:

```
alias: name<1>, name<2>, name<3>
```

where *alias* is the mailing list name and the *name<i>* are the members of the list. Long lists can be continued onto the next line by starting the next line with a space or tab. Remember that you must execute the shell command *newaliases* after editing /usr/lib/aliases since the delivery system uses an indexed file created by *newaliases*.

We have seen that *Mail* can be invoked with command line arguments which are people to send the message to, or with no arguments to read mail. Specifying the -f flag on the command line causes *Mail* to read messages from a file other than your system mailbox. For example, if you have a collection of messages in the file "letters" you can use *Mail* to read them with:

% Mail -f letters

You can use all the *Mail* commands described in this document to examine, modify, or delete messages from your "letters" file, which will be rewritten when you leave *Mail* with the *quit* command described below.

Since mail that you read is saved in the file *mbox* in your home directory by default, you can read *mbox* in your home directory by using simply

% Mail -f

Normally, messages that you examine using the *type* command are saved in the file "mbox" in your home directory if you leave *Mail* with the *quit* command described below. If you wish to retain a message in your system mailbox you can use the *preserve* command to tell *Mail* to leave it there. The *preserve* command accepts a list of message numbers, just like *type* and may be abbreviated to *pre*.

Messages in your system mailbox that you do not examine are normally retained in your system mailbox automatically. If you wish to have such a message saved in *mbox* without reading it, you may use the *mbox* command to have them so saved. For example,

mbox 2

in our example would cause the second message (from sam) to be saved in *mbox* when the *quit* command is executed. *Mbox* is also the way to direct messages to your *mbox* file if you have set the "hold" option described above. *Mbox* can be abbreviated to *mb*.

When you have perused all the messages of interest, you can leave *Mail* with the *quit* command, which saves the messages you have typed but not deleted in the file *mbox* in your login directory. Deleted messages are discarded irretrievably, and messages left untouched are preserved in your system mailbox so that you will see them the next time you type:

% Mail

The *quit* command can be abbreviated to simply *q*.

If you wish for some reason to leave *Mail* quickly without altering either your system mailbox or *mbox*, you can type the *x* command (short for *exit*), which will immediately return you to the Shell without changing anything.

If, instead, you want to execute a Shell command without leaving *Mail*, you can type the command preceded by an exclamation point, just as in the text editor. Thus, for instance:

```
!date
```

will print the current date without leaving *Mail*.

Finally, the *help* command is available to print out a brief summary of the *Mail* commands, using only the single character command abbreviations.

3. Maintaining folders

Mail includes a simple facility for maintaining groups of messages together in folders. This section describes this facility.

To use the folder facility, you must tell *Mail* where you wish to keep your folders. Each folder of messages will be a single file. For convenience, all of your folders are kept in a single directory of your choosing. To tell *Mail* where your folder directory is, put a line of the form

```
set folder=letters
```

in your *.mailrc* file. If, as in the example above, your folder directory does not begin with a '/,' *Mail* will assume that your folder directory is to be found starting from your home directory. Thus, if your home directory is */usr/person* the above example told *Mail* to find your folder directory in */usr/person/letters*.

Anywhere a file name is expected, you can use a folder name, preceded with '+.' For example, to put a message into a folder with the *save* command, you can use:

```
save +classwork
```

to save the current message in the *classwork* folder. If the *classwork* folder does not yet exist, it will be created. Note that messages which are saved with the *save* command are automatically removed from your system mailbox.

In order to make a copy of a message in a folder without causing that message to be removed from your system mailbox, use the *copy* command, which is identical in all other respects to the *save* command. For example,

```
copy +classwork
```

copies the current message into the *classwork* folder and leaves a copy in your system mailbox.

The *folder* command can be used to direct *Mail* to the contents of a different folder. For example,

```
folder +classwork
```

directs *Mail* to read the contents of the *classwork* folder. All of the commands that you can use on your system mailbox are also applicable to folders, including *type*, *delete*, and *reply*. To inquire which folder you are currently editing, use simply:

```
folder
```

To list your current set of folders, use the *folders* command.

To start *Mail* reading one of your folders, you can use the *-f* option described in section 2. For example:

```
% Mail -f +classwork
```

will cause *Mail* to read your *classwork* folder without looking at your system mailbox.

4. *More about sending mail*

4.1. *Tilde escapes*

While typing in a message to be sent to others, it is often useful to be able to invoke the text editor on the partial message, print the message, execute a shell command, or do some other auxiliary function. *Mail* provides these capabilities through *tilde escapes*, which consist of a tilde (~) at the beginning of a line, followed by a single character which indicates the function to be performed. For example, to print the text of the message so far, use:

```
~p
```

which will print a line of dashes, the recipients of your message, and the text of the message so far. Since *Mail* requires two consecutive RUBOUT's to abort a letter, you can use a single RUBOUT to abort the output of ~p or any other ~ escape without killing your letter.

If you are dissatisfied with the message as it stands, you can invoke the text editor on it using the escape

```
~e
```

which causes the message to be copied into a temporary file and an instance of the editor to be spawned. After modifying the message to your satisfaction, write it out and quit the editor. *Mail* will respond by typing

```
(continue)
```

after which you may continue typing text which will be appended to your message, or type <control-d> to end the message. A standard text editor is provided by *Mail*. You can override this default by setting the valued option "EDITOR" to something else. For example, you might prefer:

```
set EDITOR=/usr/ucb/ex
```

Many systems offer a screen editor as an alternative to the standard text editor, such as the *vi* editor from UC Berkeley. To use the screen, or *visual* editor, on your current message, you can use the escape,

```
~v
```

~v works like ~e, except that the screen editor is invoked instead. A default screen editor is defined by *Mail*. If it does not suit you, you can set the valued option "VISUAL" to the path name of a different editor.

It is often useful to be able to include the contents of some file in your message; the escape

~r filename

is provided for this purpose, and causes the named file to be appended to your current message. *Mail* complains if the file doesn't exist or can't be read. If the read is successful, the number of lines and characters appended to your message is printed, after which you may continue appending text. The filename may contain shell metacharacters like * and ? which are expanded according to the conventions of your shell.

As a special case of ~r, the escape

~d

reads in the file "dead.letter" in your home directory. This is often useful since *Mail* copies the text of your message there when you abort a message with RUBOUT.

To save the current text of your message on a file you may use the

~w filename

escape. *Mail* will print out the number of lines and characters written to the file, after which you may continue appending text to your message. Shell metacharacters may be used in the filename, as in ~r and are expanded with the conventions of your shell.

If you are sending mail from within *Mail's* command mode you can read a message sent to you into the message you are constructing with the escape:

~m 4

which will read message 4 into the current message, shifted right by one tab stop. You can name any non-deleted message, or list of messages. Messages can also be forwarded without shifting by a tab stop with ~f. This is the usual way to forward a message.

If, in the process of composing a message, you decide to add additional people to the list of message recipients, you can do so with the escape

~t name1 name2 ...

You may name as few or many additional recipients as you wish. Note that the users originally on the recipient list will still receive the message; you cannot remove someone from the recipient list with ~t.

If you wish, you can associate a subject with your message by using the escape

~s Arbitrary string of text

which replaces any previous subject with "Arbitrary string of text." The subject, if given, is sent near the top of the message prefixed with "Subject:" You can see what the message will look like by using ~p.

For political reasons, one occasionally prefers to list certain people as recipients of carbon copies of a message rather than direct recipients. The escape

~c name1 name2 ...

adds the named people to the "Cc:" list, similar to ~t. Again, you can execute ~p to see what the message will look like.

One can also send carbon copies to recipients whose names will not be present in the message, so that other recipients will not know that these "blind" carbon copies were sent. The escape

~b name1 name2 ...

adds the named people to the "Bcc:" list.

The recipients of the message together constitute the "To:" field, the subject the "Subject:" field, the carbon copies the "Cc:" field, and the blind carbon copies the "Bcc:" field. If you wish to edit these in ways impossible with the ~t, ~s, and ~c escapes, you can use the escape

~h

which prints "To:" followed by the current list of recipients and leaves the cursor (or printhead) at the end of the line. If you type in ordinary characters, they are appended to the end of the current list of recipients. You can also use your erase character to erase back into the list of recipients, or your kill character to erase them altogether. Thus, for example, if your erase and kill characters are the standard control-h and control-u,

~h
To: root kurt^H^H^H^Hbill

would change the initial recipients "root kurt" to "root bill." When you type a newline, *Mail* advances to the "Subject:" field, where the same rules apply. Another newline brings you to the "Cc:" field, which may be edited in the same fashion. Another brings you to the "Bcc:" field. Another newline leaves you appending text to the end of your message. You can use ~p to print the current text of the header fields and the body of the message.

To effect a temporary escape to the shell, the escape

~!command

is used, which executes *command* and returns you to mailing mode without altering the text of your message. If you wish, instead, to filter the body of your message through a shell command, then you can use

~|command

which pipes your message through the command and uses the output as the new text of your message. If the command produces no output, *Mail* assumes that something is amiss and retains the old version of your message. A frequently-used filter is the command *fmt*, designed to format outgoing mail.

To effect a temporary escape to *Mail* command mode instead, you can use the

~:*Mail command*

escape. This is especially useful for retyping the message you are replying to, using, for example:

~:t

It is also useful for setting options and modifying aliases.

If you wish (for some reason) to send a message that contains a line beginning with a tilde, you must double it. Thus, for example,

~~This line begins with a tilde.

sends the line

~This line begins with a tilde.

Finally, the escape

~?

prints out a brief summary of the available tilde escapes.

On some terminals (particularly ones with no lower case) tilde's are difficult to type. *Mail* allows you to change the escape character with the "escape" option. For example, I set

set escape=]

and use a right bracket instead of a tilde. If I ever need to send a line beginning with right bracket, I double it, just as for ~. Changing the escape character removes the special meaning of ~.

4.2. Network access

This section describes how to send mail to people on other machines. Recall that sending to a plain login name sends mail to that person on your machine. If your machine is connected to a network, you can send messages to people on the network using a name of the form

name@host

where *name* is the login name of the person you're trying to reach and *host* is the name of the machine where he logs in.

When you use the *reply* command to respond to a letter, there is a problem of figuring out the names of the users in the "To:" and "Cc:" lists *relative to the current machine*. If the original letter was sent to you by someone on the local machine, then this problem does not exist, but if the message came from a remote machine, the problem must be dealt with. *Mail* uses a heuristic to build the correct name for each user relative to the local machine. So, when you *reply* to remote mail, the names in the "To:" and "Cc:" lists may change somewhat.

4.3. Special recipients

As described previously, you can send mail to either user names or *alias* names. It is also possible to send messages directly to files or to programs, using special conventions. If a recipient name has a '/' in it or begins with a '+', it is assumed to be the path name of a file into which to send the message. If the file already exists, the message is appended to the end of the file. If you want to name a file in your current directory (ie, one for which a '/' would not usually be needed) you can precede the name with './' So, to send mail to the file "memo" in the current directory, you can give the command:

% Mail ./memo

If the name begins with a '+,' it is expanded into the full path name of the folder name in your folder directory. This ability to send mail to files can be used for a variety of purposes, such as maintaining a journal and keeping a record of mail sent to a certain group of users. The second example can be done automatically by including the full pathname of the record file in the *alias* command for the group. Using our previous *alias* example, you might give the command:

alias project sam sally steve susan /usr/project/mail_record

Then, all mail sent to "project" would be saved on the file "/usr/project/mail_record" as well as being sent to the members of the project. This file can be examined using *Mail -f*.

It is sometimes useful to send mail directly to a program, for example one might write a project billboard program and want to access it using *Mail*. To send messages to the billboard program, one can send mail to the special name '|billboard' for example. *Mail* treats

recipient names that begin with a '|' as a program to send the mail to. An *alias* can be set up to reference a '|' prefaced name if desired. *Caveats*: the shell treats '|' specially, so it must be quoted on the command line. Also, the '| program' must be presented as a single argument to mail. The safest course is to surround the entire name with double quotes. This also applies to usage in the *alias* command. For example, if we wanted to alias 'rmsgs' to 'rmsgs -s' we would need to say:

```
alias rmsgs "| rmsgs -s"
```

5. *Additional features*

This section describes some additional commands of use for reading your mail, setting options, and handling lists of messages.

5.1. *Message lists*

Several *Mail* commands accept a list of messages as an argument. Along with *type* and *delete*, described in section 2, there is the *from* command, which prints the message headers associated with the message list passed to it. The *from* command is particularly useful in conjunction with some of the message list features described below.

A *message list* consists of a list of message numbers, ranges, and names, separated by spaces or tabs. Message numbers may be either decimal numbers, which directly specify messages, or one of the special characters "↑" "." or "$" to specify the first relevant, current, or last relevant message, respectively. *Relevant* here means, for most commands "not deleted" and "deleted" for the *undelete* command.

A range of messages consists of two message numbers (of the form described in the previous paragraph) separated by a dash. Thus, to print the first four messages, use

```
type 1-4
```

and to print all the messages from the current message to the last message, use

```
type .-$
```

A *name* is a user name. The user names given in the message list are collected together and each message selected by other means is checked to make sure it was sent by one of the named users. If the message consists entirely of user names, then every message sent by one those users that is *relevant* (in the sense described earlier) is selected. Thus, to print every message sent to you by "root," do

```
type root
```

As a shorthand notation, you can specify simply "*" to get every *relevant* (same sense) message. Thus,

```
type *
```

prints all undeleted messages,

```
delete *
```

deletes all undeleted messages, and

```
undelete *
```

undeletes all deleted messages.

You can search for the presence of a word in subject lines with /. For example, to print the headers of all messages that contain the word "PASCAL," do:

```
from /pascal
```

Note that subject searching ignores upper/lower case differences.

5.2. List of commands

This section describes all the *Mail* commands available when receiving mail.

! Used to preface a command to be executed by the shell.

- The - command goes to the previous message and prints it. The - command may be given a decimal number *n* as an argument, in which case the *n*th previous message is gone to and printed.

= Prints the current message number.

? Synonym for *help*.

Ignored. This is to allow comments in *.mailrc* files.

Print
: Like *print*, but also print out ignored header fields. See also *print* and *ignore*.

Reply
: Note the capital R in the name. Frame a reply to a one or more messages. The reply (or replies if you are using this on multiple messages) will be sent ONLY to the person who sent you the message (respectively, the set of people who sent the messages you are replying to). You can add people using the *~t* and *~c* tilde escapes. The subject in your reply is formed by prefacing the subject in the original message with "Re:" unless it already began thus. If the original message included a "reply-to" header field, the reply will go *only* to the recipient named by "reply-to." You type in your message using the same conventions available to you through the *mail* command. The *Reply* command is especially useful for replying to messages that were sent to enormous distribution groups when you really just want to send a message to the originator. Use it often.

Respond
: Synonym for *Reply*.

Type Identical to the *Print* command.

alias
Define a name to stand for a set of other names. This is used when you want to send messages to a certain group of people and want to avoid retyping their names. For example

```
alias project john sue willie kathryn
```

creates an alias *project* which expands to the four people John, Sue, Willie, and Kathryn.

alternates
If you have accounts on several machines, you may find it convenient to use the /usr/lib/aliases on all the machines except one to direct your mail to a single account. The *alternates* command is used to inform *Mail* that each of these other addresses is really *you*. *Alternates* takes a list of user names and remembers that they are all actually you. When you *reply* to messages that were sent to one of these alternate names, *Mail* will not bother to send a copy of the message to this other address (which would simply be directed back to you by the alias mechanism). If *alternates* is given no argument, it lists the current set of alternate names. *Alternates* is usually used in the .mailrc file.

cd The *cd* command allows you to change your current directory. *Cd* takes a single argument, which is taken to be the pathname of the directory to change to. If no argument is given, *cd* changes to your home directory.

chdir
Synonym for *cd*.

copy The *copy* command does the same thing that *save* does, except that it does not mark the messages it is used on for deletion when you quit.

core Dumps the virtual memory of *Mail* into a *core* file for debugging.

delete
Deletes a list of messages. Deleted messages can be reclaimed with the *undelete* command.

discard
Synonym for *ignore*.

dp The *dp* command deletes the current message and prints the next message. It is useful for quickly reading and disposing of mail.

dt Synonym for *dp*.

echo Types out the argument to the terminal. Useful for debugging *.mailrc* files with conditional statements.

edit To edit individual messages using a text editor, the *edit* command is provided. The *edit* command takes a list of messages as described under the *type* command and processes each by writing it into the file Message*x* where *x* is the message number being edited and executing the text editor defined by the variable *EDITOR* on it. When you have edited the message to your satisfaction, write the message out and quit, upon which *Mail* will read the message back and remove the file. *Edit* may be abbreviated to *e*.

else Marks the end of the then-part of an *if* statement and the beginning of the part to take effect if the condition of the *if* statement is false.

endif
Marks the end of an *if* statement.

exit Leave *Mail* without updating the system mailbox or the file your were reading. Thus, if you accidentally delete several messages, you can use *exit* to avoid scrambling your mailbox.

file The same as *folder*.

folder
The *folder* command switches to a new mail file or folder. With no arguments, it tells you which file you are currently reading. If you give it an argument, it will write out changes (such as deletions) you have made in the current file and read the new file. Some special conventions are recognized for the name:

Name	Meaning
#	Previous file read
%	Your system mailbox
%name	*Name*'s system mailbox
&	Your ~/mbox file
+folder	A file in your folder directory

folders
List the names of the folders in your folder directory.

from The *from* command takes a list of messages and prints out the header lines for each one; hence

```
from joe
```

is the easy way to display all the message headers from "joe."

group
Synonym for *alias*.

headers

When you start up *Mail* to read your mail, it lists the message headers that you have. These headers tell you who each message is from, when they were sent, how many lines and characters each message is, and the "Subject:" header field of each message, if present. In addition, *Mail* tags the message header of each message that has been the object of the *preserve* command with a "P." Messages that have been *saved* or *written* are flagged with a "*." Finally, *deleted* messages are not printed at all. If you wish to reprint the current list of message headers, you can do so with the *headers* command. The *headers* command (and thus the initial header listing) only lists the first so many message headers. The number of headers listed depends on the speed of your terminal. This can be overridden by specifying the number of headers you want with the *window* option. *Mail* maintains a notion of the current "window" into your messages for the purposes of printing headers. Use the *z* command to move forward and back a window. You can move *Mail's* notion of the current window directly to a particular message by using, for example,

```
headers 40
```

to move *Mail's* attention to the messages around message 40. The *headers* command can be abbreviated to *h*.

help Print a brief and usually out of date help message about the commands in *Mail*. Refer to this manual instead.

hold Arrange to hold a list of messages in the system mailbox, instead of moving them to the file *mbox* in your home directory. If you set the binary option *hold*, this will happen by default.

if Commands in your ".mailrc" file can be executed conditionally depending on whether you are sending or receiving mail with the *if* command. For example, you can do:

```
if receive
        commands...
endif
```

An *else* form is also available:

```
if send
        commands...
else
        commands...
endif
```

Note that the only allowed conditions are *receive* and *send*.

ignore

Add the list of header fields named to the *ignore list*. Header fields in the ignore list are not printed on your terminal when you

print a message. This allows you to suppress printing of certain machine-generated header fields, such as *Via* which are not usually of interest. The *Type* and *Print* commands can be used to print a message in its entirety, including ignored fields. If *ignore* is executed with no arguments, it lists the current set of ignored fields.

list List the valid *Mail* commands.

local
Define a list of local names for this host. This command is useful when the host is known by more than one name. Names in the list may be qualified be the domain of the host. The first name on the local list is the *distinguished* name of the host. The names on the local list are used by *Mail* to decide which addresses are local to the host. For example:

```
local ucbarpa.BERKELEY.ARPA arpa.BERKELEY.ARPA \
        arpavax.BERKELEY.ARPA r.BERKELEY.ARPA \
        ucb-arpa.ARPA
```

From this list we see that *fred@ucbarpa.BERKELEY.ARPA*, *harold@arpa.BERKELEY*, and *larry@r* are all addresses of users on the local host. The *local* command is usually not used be general users since it is designed for local configuration; it is usually found in the file /usr/lib/Mail.rc.

mail Send mail to one or more people. If you have the *ask* option set, *Mail* will prompt you for a subject to your message. Then you can type in your message, using tilde escapes as described in section 4 to edit, print, or modify your message. To signal your satisfaction with the message and send it, type control-d at the beginning of a line, or a . alone on a line if you set the option *dot*. To abort the message, type two interrupt characters (RUBOUT by default) in a row or use the *~q* escape.

mbox Indicate that a list of messages be sent to *mbox* in your home directory when you quit. This is the default action for messages if you do *not* have the *hold* option set.

next The *next* command goes to the next message and types it. If given a message list, *next* goes to the first such message and types it. Thus,

```
next root
```

goes to the next message sent by "root" and types it. The *next* command can be abbreviated to simply a newline, which means that one can go to and type a message by simply giving its message number or one of the magic characters "^" "." or "$". Thus,

.

prints the current message and

```
4
```

prints message 4, as described previously.

print
Save as *type*.

preserve
Synonym for *hold*. Cause a list of messages to be held in your system mailbox when you quit.

quit Leave *Mail* and update the file, directory, folder, or system mailbox your were reading. Messages that you have examined are marked as "read" and messages that existed when you started are marked as "old." If you were editing your system mailbox and if you have set the binary option *hold*, all messages which have not been deleted, saved, or mboxed will be retained in your system mailbox. If you were editing your system mailbox and you did *not* have *hold* set, all messages which have not been deleted, saved, or preserved will be moved to the file or directory *mbox* in your home directory.

reply
Frame a reply to a single message. The reply will be sent to the person who sent you the message to which you are replying, plus all the people who received the original message, except you. You can add people using the *~t* and *~c* tilde escapes. The subject in your reply is formed by prefacing the subject in the original message with "Re:" unless it already began thus. If the original message included a "reply-to" header field, the reply will go *only* to the recipient named by "reply-to." You type in your message using the same conventions available to you through the *mail* command.

respond
Synonym for *reply*.

save It is often useful to be able to save messages on related topics in a file. The *save* command gives you ability to do this. The *save* command takes as argument a lit of message numbers, followed by the name of the file on which to save the messages. The messages are appended to the named file, thus allowing one to keep several messages in the file, stored in the order they were put there. The *save* command can be abbreviated to *s*. An example of the *save* command relative to our running example is:

```
s 1 2 tuitionmail
```

Saved messages are not automatically saved in *mbox* at quit time, nor are they selected by the *next* command described above, unless explicitly specified.

set Set an option or give an option a value. Used to customize *Mail*. Section 5.3 contains a list of the options. Options can be *binary*, in which case they are *on* or *off*, or *valued*. To set a binary option *option on*, do

```
set option
```

To give the valued option *option* the value *value*, do

```
set option=value
```

Several options can be specified in a single *set* command.

shell
The *shell* command allows you to escape to the shell. *Shell* invokes an interactive shell and allows you to type commands to it. When you leave the shell, you will return to *Mail*. The shell used is a default assumed by *Mail*; you can override this default by setting the valued option "SHELL," eg:

```
set SHELL=/bin/csh
```

size Prints the size of each message in the given message list.

source
The *source* command reads *Mail* commands from a file. It is useful when you are trying to fix your ".mailrc" file and you need to re-read it.

top The *top* command takes a message list and prints the first five lines of each addressed message. It may be abbreviated to *to*. If you wish, you can change the number of lines that *top* prints out by setting the valued option "toplines." On a CRT terminal,

```
set toplines=10
```

might be preferred.

touch
Cause a list of messages to be considered "touched" so that they will be moved to your *mbox* even though they have not actually been read. There is no real difference between this and *mbox* as far as the end result is concerned, though they are implemented differently.

type Print a list of messages on your terminal. If you have set the option *crt* to a number and the total number of lines in the messages you are printing exceed that specified by *crt*, the messages will be printed by a terminal paging program such as *more*.

undelete
The *undelete* command causes a message that had been deleted

previously to regain its initial status. Only messages that have been deleted may be undeleted. This command may be abbreviated to *u*.

unset
Reverse the action of setting a binary or valued option.

version
Reports the version number of *Mail*.

visual
It is often useful to be able to invoke one of two editors, based on the type of terminal one is using. To invoke a display oriented editor, you can use the *visual* command. The operation of the *visual* command is otherwise identical to that of the *edit* command.

Both the *edit* and *visual* commands assume some default text editors. These default editors can be overridden by the valued options "EDITOR" and "VISUAL" for the standard and screen editors. You might want to do something like:

```
set EDITOR=/usr/ucb/ex VISUAL=/usr/ucb/vi
```

which are the defaults.

write
The *save* command always writes the entire message, including the headers, into the file. If you want to write just the message itself, you can use the *write* command. The *write* command has the same syntax as the *save* command, and can be abbreviated to simply *w*. Thus, we could write the second message by doing:

```
w 2 file.c
```

As suggested by this example, the *write* command is useful for such tasks as sending and receiving source program text over the message system.

xit Synonym for *exit*.

z *Mail* presents message headers in windowfuls as described under the *headers* command. You can move *Mail's* attention forward to the next window by giving the

```
z+
```

command. Analogously, you can move to the previous window with:

```
z-
```

5.3. Custom options

Throughout this manual, we have seen examples of binary and valued options. This section describes each of the options in alphabetical order, including some that you have not seen yet. To avoid confusion, please note that the options are either all lower case letters or all upper case letters. When I start a sentence such as: "Ask" causes *Mail* to prompt you for a subject header, I am only capitalizing "ask" as a courtesy to English.

EDITOR

The valued option "EDITOR" defines the pathname of the text editor to be used in the *edit* command and ~e. If not defined, the editor "/usr/ucb/ex" is used.

SHELL

The valued option "SHELL" gives the path name of your shell. This shell is used for the ! and *shell* commands and ~! escape. In addition, this shell expands file names with shell metacharacters like * and ? in them, and is used to call programs which filter text.

VISUAL

The valued option "VISUAL" defines the pathname of your screen editor for use in the *visual* command and ~v escape. "/usr/ucb/vi" is used if you do not define one.

append

The "append" option is binary and causes messages saved in an *mbox* file to be appended to the end rather than prepended. Normally, *Mail*will *mbox* file in the same order that the system puts messages in your system mailbox. By setting "append," you are requesting that *mbox* be appended to regardless. It is in any event quicker to append.

ask "Ask" is a binary option which causes *Mail* to prompt you for the subject of each message you send. If you respond with simply a newline, no subject field will be sent.

askcc

"Askcc" is a binary option which causes you to be prompted for additional carbon copy recipients at the end of each message. Responding with a newline shows your satisfaction with the current list.

autoprint

"Autoprint" is a binary option which causes the *delete* command to behave like *dp* -- thus, after deleting a message, the next one will be typed automatically. This is useful to quickly scanning and deleting messages in your mailbox.

crt The valued option "crt" indicates the minimum number of lines of text which should be displayed before using *more*.

dot "Dot" is a binary option which, if set, causes *Mail* to interpret a period alone on a line as the terminator of a message you are sending. This is the default at the ITC.

escape
To allow you to change the escape character used when sending mail, you can set the valued option "escape." Only the first character of the "escape" option is used, and it must be doubled if it is to appear as the first character of a line of your message. If you change your escape character, then ~ loses all its special meaning, and need no longer be doubled at the beginning of a line.

folder
The name of the directory to use for storing folders of messages. If this name begins with a '/' *Mail* considers it to be an absolute pathname; otherwise, the folder directory is found relative to your home directory.

hold The binary option "hold" causes messages that have been read but not manually dealt with to be held in the system mailbox. This prevents such messages from being automatically swept into your mbox.

ignore
The binary option "ignore" causes control-c characters from your terminal to be ignored and echoed as @'s while you are sending mail. Control-c characters retain their original meaning in *Mail* command mode. Setting the "ignore" option is equivalent to supplying the *-i* flag on the command line as described in section 6.

ignoreeof
An option related to "dot" is "ignoreeof" which makes *Mail* refuse to accept a control-d as the end of a message. "Ignoreeof" also applies to *Mail* command mode.

keep The "keep" option causes *Mail* to truncate your system mailbox instead of deleting it when it is empty. This is useful if you elect to protect your mailbox, which you would do with the shell command:

```
chmod 600 /usr/spool/mail/yourname
```

where *yourname* is your login name. If you do not do this, anyone can probably read your mail, although people usually don't. This is not necessary if you are using a "Mailbox" directory in your home directory as your mailbox, since messages are always removed from it individually.

keepsave
When you *save* a message, *Mail* usually discards it when you *quit*. To retain all saved messages, set the "keepsave" option.

metoo

When sending mail to an alias, *Mail* makes sure that if you are included in the alias, that mail will not be sent to you. This is useful if a single alias is being used by all members of the group. If however, you wish to receive a copy of all the messages you send to the alias, you can set the binary option "metoo."

noheader

The binary option "noheader" suppresses the printing of the version and headers when *Mail* is first invoked. Setting this option is the same as using *-N* on the command line.

nosave

Normally, when you abort a message with two control-c's, *Mail* copies the partial letter to the file "dead.letter" in your home directory. Setting the binary option "nosave" prevents this.

quiet

The binary option "quiet" suppresses the printing of the version when *Mail* is first invoked, as well as printing the message identification lines from the *type* command, for example "Message 4:".

record

If you love to keep records, then the valued option "record" can be set to the name of a file to save your outgoing mail. Each new message you send is appended to the end of the file.

screen

When *Mail* initially prints the message headers, it determines the number to print by looking at the speed of your terminal. The faster your terminal, the more it prints. The valued option "screen" overrides this calculation and specifies how many message headers you want printed. This number is also used for scrolling with the *z* command.

sendmail

To alternate delivery system, set the "sendmail" option to the full pathname of the program to use. Note: this is not for everyone! Most people should use the default delivery system.

toplines

The valued option "toplines" defines the number of lines that the "top" command will print out instead of the default five lines.

verbose

The binary option "verbose" causes *Mail* to invoke sendmail with the *-v* flag, which causes it to go into verbose mode and announce expansion of aliases, etc. Setting the "verbose" option is equivalent to invoking *Mail* with the *-v* flag as described in section 6.

6. Command line options

This section describes command line options for *Mail* and what they are used for.

-N Suppress the initial printing of headers.

-d Turn on debugging information. Not of general interest.

-f file
Show the messages in *file* instead of your system mailbox. If *file* is omitted, *Mail* reads *mbox* in your home directory.

-i Ignore tty interrupt signals. Useful on noisy phone lines, which generate spurious RUBOUT or DELETE characters. It's usually more effective to change your interrupt character to control-c, for which see the *stty* shell command.

-n Inhibit reading of /usr/lib/Mail.rc. Not generally useful, since /usr/lib/Mail.rc is usually empty.

-s string
Used for sending mail. *String* is used as the subject of the message being composed. If *string* contains blanks, you must surround it with quote marks.

-u name
Read *name's* mail instead of your own. Unwitting others often neglect to protect their mailboxes, but discretion is advised. Essentially, *-u user* is a shorthand way of doing *-f /usr/spool/user*.

-v Use the *-v* flag when invoking sendmail. This feature may also be enabled by setting the the option "verbose".

The following command line flags are also recognized, but are intended for use by programs invoking *Mail* and not for people.

-T file
Arrange to print on *file* the contents of the *article-id* fields of all messages that were either read or deleted. *-T* is for the *readnews* program and should NOT be used for reading your mail.

-h number
Pass on hop count information. *Mail* will take the number, increment it, and pass it with *-h* to the mail delivery system. *-h* only has effect when sending mail and is used for network mail forwarding.

-r name
Used for network mail forwarding: interpret *name* as the sender of the message. The *name* and *-r* are simply sent along to the mail delivery system. Also, *Mail* will wait for the message to be sent

and return the exit status. Also restricts formatting of message.

Note that *-h* and *-r*, which are for network mail forwarding, are not used in practice since mail forwarding is now handled separately. They may disappear soon.

7. Format of messages

When messages are stored in ordinary files, they are stored one after another in the format given below, with a blank line separating messages. When messages are stored in a "Mailbox" system directory the are stored in individual files with unique names; the mail delivery system creates files with names based on the date and time of delivery.

Messages begin with a *from* line, which consists of the word "From" followed by a user name, followed by anything, followed by a date in the format returned by the *ctime* library routine described in section 3 of the Unix Programmer's Manual. A possible *ctime* format date is:

Tue Dec 1 10:58:23 1981

The *ctime* date may be optionally followed by a single space and a time zone indication, which should be three capital letters, such as PDT.

Following the *from* line are zero or more *header field* lines. Each header field line is of the form:

name: information

Name can be anything, but only certain header fields are recognized as having any meaning. The recognized header fields are: *article-id*, *bcc*, *cc*, *from*, *reply-to*, *sender*, *subject*, and *to*. Other header fields are also significant to other systems; see, for example, the current Arpanet message standard for much more on this topic. A header field can be continued onto following lines by making the first character on the following line a space or tab character.

If any headers are present, they must be followed by a blank line. The part that follows is called the *body* of the message, and must be ASCII text, not containing null characters. Each line in the message body must be terminated with an ASCII newline character and no line may be longer than 512 characters. If binary data must be passed through the mail system, it is suggested that this data be encoded in a system which encodes six bits into a printable character. For example, one could use the upper and lower case letters, the digits, and the characters comma and period to make up the 64 characters. Then, one can send a 16-bit binary number as three characters. These characters should be packed into lines, preferably lines about 70 characters long as long lines are transmitted more efficiently.

The UUCP message delivery system sometimes adds a blank line to the end of a message each time it is forwarded through a machine.

It should be noted that some network transport protocols enforce limits to the lengths of messages.

8. Glossary

This section contains the definitions of a few phrases peculiar to *Mail*.

alias
An alternative name for a person or list of people.

flag An option, given on the command line of *Mail*, prefaced with a -. For example, *-f* is a flag.

header field
At the beginning of a message, a line which contains information that is part of the structure of the message. Popular header fields include *to*, *cc*, and *subject*.

mail
A collection of messages. Often used in the phrase, "Have you read your mail?"

mailbox
The place where your mail is stored, typically in the directory /usr/spool/mail, or the directory "Mailbox" in your home directory.

message
A single letter from someone, initially stored in your *mailbox*.

message list
A string used in *Mail* command mode to describe a sequence of messages.

option
A piece of special purpose information used to tailor *Mail* to your taste. Options are specified with the *set* command.

9. Summary of commands, options, and escapes

This section gives a quick summary of the *Mail* commands, binary and valued options, and tilde escapes.

The following table describes the commands:

Command	*Description*
!	Single command escape to shell
-	Back up to previous message
Print	Type message with ignored fields
Reply	Reply to author of message only, synonym Respond
Type	Type message with ignored fields
alias	Define an alias as a set of user names, synonym group
alternates	List other names you are known by
chdir	Change working directory, home by default, synonym cd
copy	Copy a message to a file or folder
delete	Delete a list of messages, synonym discard
dt	Delete current message, type next message, synonym dp
echo	Echo the command
edit	Edit a list of messages
else	Start of else part of conditional; see if
endif	End of conditional statement; see if
exit	Leave mail without changing anything, synonym xit
file	Interrogate/change current mail file, synonym folder
folders	List the folders in your folder directory
from	List headers of a list of messages
headers	List current window of messages
help	Print brief summary of *Mail* commands
if	Conditional execution of *Mail* commands
ignore	Set/examine list of ignored header fields
list	List valid *Mail* commands
local	List other names for the local host
mail	Send mail to specified names
mbox	Arrange to save a list of messages in *mbox*
next	Go to next message and type it
preserve	Arrange to leave list of messages in system mailbox, synonym hold
quit	Leave *Mail*; update system mailbox, *mbox* as appropriate
reply	Compose a reply to a message, synonym respond
save	Append messages, headers included, on a file
set	Set binary or valued options
shell	Invoke an interactive shell
size	Print size of messages
top	Print first so many (5 by default) lines of list of messages
touch	Arrange to save a list of messages in *mbox*
type	Print messages, synonym print
undelete	Undelete list of messages
unset	Undo the operation of a set
version	Print version number of *Mail*
visual	Invoke visual editor on a list of messages
write	Append messages to a file, don't include headers
z	Scroll to next/previous screenful of headers

The following table describes the options. Each option is shown as being either a binary or valued option.

Option	*Type*	*Description*
EDITOR	*valued*	Pathname of editor for ~e and edit
SHELL	*valued*	Pathname of shell for shell, ~! and !
VISUAL	*valued*	Pathname of screen editor for ~v, visual
append	*binary*	Always append messages to end of *mbox*
ask	*binary*	Prompt user for Subject: field when sending
askcc	*binary*	Prompt user for additional Cc's at end of message
autoprint	*binary*	Print next message after delete
crt	*valued*	Minimum number of lines before using *more*
dot	*binary*	Accept . alone on line to terminate message input
escape	*valued*	Escape character to be used instead of ~
folder	*valued*	Directory to store folders in
hold	*binary*	Hold messages in system mailbox by default
ignore	*binary*	Ignore ↑C while sending mail
ignoreeof	*binary*	Don't terminate letters/command input with ↑D
keep	*binary*	Don't unlink system mailbox when empty
keepsave	*binary*	Don't delete saved messages by default
metoo	*binary*	Include sending user in aliases
noheader	*binary*	Suppress initial printing of version and headers
nosave	*binary*	Don't save partial letter in *dead.letter*
quiet	*binary*	Suppress printing of *Mail* version and message numbers
record	*valued*	File to save all outgoing mail in
screen	*valued*	Size of window of message headers for z, etc.
sendmail	*valued*	Choose alternate mail delivery system
toplines	*valued*	Number of lines to print in top
verbose	*binary*	Invoke sendmail with the -v flag

The following table summarizes the tilde escapes available while sending mail.

Escape	*Arguments*	*Description*
~!	*command*	Execute shell command
~:	*command*	Execute Mail command
~b	*name ...*	Add names to Bcc: field
~c	*name ...*	Add names to Cc: field
~d		Read *dead.letter* into message
~e		Invoke text editor on partial message
~f	*messages*	Read named messages
~h		Edit the header fields
~m	*messages*	Read named messages, right shift by tab
~p		Print message entered so far
~q		Abort entry of letter; like RUBOUT
~r	*filename*	Read file into message
~s	*string*	Set Subject: field to *string*
~t	*name ...*	Add names to To: field
~v		Invoke screen editor on message
~w	*filename*	Write message on file
~|	*command*	Pipe message through *command*
~.		End of input
~Q		Quit, do not send
~C		Dump memory for debugging.
~?		Print this list
~~	*string*	Quote a ~ in front of *string*

The following table shows the command line flags that *Mail* accepts:

Flag	Description
-N	Suppress the initial printing of headers
-T *file*	Article-id's of read/deleted messages to *file*
-d	Turn on debugging
-f *file*	Show messages in *file* or *~/mbox*
-h *number*	Pass on hop count for mail forwarding
-i	Ignore tty interrupt signals
-n	Inhibit reading of /usr/lib/Mail.rc
-r *name*	Pass on *name* for mail forwarding
-s *string*	Use *string* as subject in outgoing mail
-u *name*	Read *name's* mail instead of your own
-v	Invoke sendmail with the -v flag

Notes: *-T*, *-d*, *-h*, and *-r* are not for human use.

10. Conclusion

Mail is an attempt to provide a simple user interface to a variety of underlying message systems. Thanks are due to the many users who contributed ideas and testing to *Mail*.
